1. *Chlorophyll a* (Chl *a*) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy in the blue and red regions of the visible spectrum. Chl *a* is essential for the light-dependent reactions of photosynthesis, where it converts light energy into chemical energy in the form of ATP and NADPH. The structure of Chl *a* consists of a central magnesium atom coordinated by four nitrogen atoms in a porphyrin-like ring, with a long phytol side chain attached to one of the ring carbons.

2. *Chlorophyll b* (Chl *b*) is an accessory pigment found in green plants and green algae. It is a yellow-green pigment that absorbs light energy in the blue and orange-red regions of the visible spectrum. Chl *b* transfers the absorbed energy to Chl *a* for use in photosynthesis. Its structure is similar to Chl *a*, but it has a different side chain attached to the porphyrin ring, which gives it its characteristic yellow-green color.

3. *Carotenoids* are a group of pigments found in plants and animals. They are responsible for the yellow, orange, and red colors seen in autumn foliage and in the skin of some animals. Carotenoids absorb light energy in the blue and green regions of the visible spectrum and transfer the energy to Chl *a*. They also play a role in protecting the photosynthetic apparatus from damage by reactive oxygen species. The structure of carotenoids is a long, conjugated chain of alternating single and double bonds, with various functional groups at the ends.

4. *Xanthophylls* are a subclass of carotenoids found in plants. They are responsible for the yellow color seen in some autumn foliage and in the skin of some animals. Xanthophylls absorb light energy in the blue and green regions of the visible spectrum and transfer the energy to Chl *a*. They also play a role in protecting the photosynthetic apparatus from damage by reactive oxygen species. The structure of xanthophylls is similar to carotenoids, but they have a different functional group at one end of the conjugated chain.

5. *Anthocyanins* are a group of pigments found in plants. They are responsible for the red, purple, and blue colors seen in many flowers and fruits. Anthocyanins absorb light energy in the blue and green regions of the visible spectrum. They are water-soluble pigments that are often found in the vacuoles of plant cells. The structure of anthocyanins is a complex, multi-ring system with various functional groups.

1. *Journal of the American Medical Association*, 1997; 277: 1039-1043.
